

Order of Magnitude How-To Guide: Steps for Teachers

When working with students ask or do:

1. What do numbers mean? (Measurements, precision, and rounding)
2. Quick methods of estimation (e.g. bracketing with factors of ten)
3. When is estimating appropriate, necessary, or valuable (cost/return)?
4. Small example where OoM *doesn't* work or *isn't* appropriate
5. A small example (small jar, shoebox, single person, etc.)
 - a. Something you can do in your head without much computation
 - b. Something you can do w/ paper and pencil
 - c. Incorporate visual thinking (sketches, etc.)
 - d. Break down the dimensionality
 - e. Verifying that the method works (gives an answer that you “know”)
6. Extrapolate (room or building size, larger populations)
7. The main exercise (maybe discipline dependent)
8. Discussion of assumptions/uncertainties
 - a. What are the assumptions that were made?
 - b. How do different approaches impact the result?
 - c. Is there general convergence?
9. Give reinforcement of ideas in other lessons
10. Review
